

Un-natural Death

For all the un-natural death documented in August 2017 we can see that the most common way of people had died was by homicide. People also died largely by road accidents and suicide.

Many of the homicide cases occurred in Dhaka and Gazipur. A large number of homicides were committed by stabbing. Some of the road accidents also occurred in Dhaka and Gazipur. The single largest road accident happened in Chondra of Jmalpur. Only one act of terrorism was documented in August. 12% of the un-natural death was due to suicide. Most of the suicides were done by hanging.

In the following pie chart we can see the different age groups that were affected by un-natural death.

The most common sufferers of un-natural death in the month of August are people who are at the age between 26 to 65. The following group contributed about 47% of the un-natural death. A huge number of them died because of homicide. Considerable number of children died un-naturally in the month of August; which is a very concerning fact for our country.

The youth (age between 19 to 25) are the third largest age group to suffer from un-natural death. Most of them died either by some sort of accident or by homicide. Couple of them also committed suicide.

Seniors did not suffer that much in this month as they only contributed 3% of the un-natural death.

Flood was also another cause of un-natural death in this month. At least 35 people are documented to be death by flood.

From trying to get all the data of un-natural death in the month of August for the research, I have learned that the government should give special attention to law and order as almost half of the death was due to homicide. I also learned that a youth like me should be careful of my behavior and lifestyle as I have observed all the data related to the un-natural death of youth who died by homicide or some kind of accident. I should be grateful for my life to God.
